### Basics of the Solar Wind - NASA/ADS

The solar wind is a stream of charged particles released from the upper atmosphere of the Sun, called the corona. This plasma mostly consists of electrons, protons and alpha particles with kinetic energy between 0.5 and 10 keV. The composition of the solar wind plasma also includes a mixture of materials found in the solar plasma: trace amounts of heavy ions and atomic nuclei C, N, O, Ne, Mg, Si, S, and Fe.

### Solar Power Basics (A Comprehensive Beginner's Guide)

Wind energy is actually a byproduct of the sun. The sun's uneven heating of the atmosphere, the earth's irregular surfaces (mountains and valleys), and the planet's revolution around the sun all combine to create wind. Since wind is in plentiful supply, it's a sustainable resource for as long as the sun's rays heat the planet.

Basics of the solar wind , by Nicole Meyer-Vernet Parker treated the solar atmosphere as a fluid and produced a robust model of the solar wind. It is a pleasure to read Meyer-Vernet's book; see, for example, chapter 5 – How does the solar wind blow? He gives back of the envelope derivation followed by simple fluid theory, and so forth and so on.
