**THE DOPPLER PRINCIPLE** The Doppler principle is named after the mathematician and physicist Christian Johann Doppler who first described this effect in 1842 by studying light from stars. He demonstrated that the colored appearance of moving stars was caused by their motion relative to the earth.

The flow echoes are assigned colors according to the color map chosen. Usually red, yellow, or white indicates positive Doppler shifts (approaching flow) and blue, cyan, or white indicates negative shifts (receding flow). Green is added to indicate variance (disturbed or turbulent flow).

**BASIC PRINCIPLES** Ultrasound images of flow, whether color flow or spectral Doppler, are essentially obtained from measurements of movement. In ultrasound scanners, a series of pulses is transmitted to detect movement of blood. Echoes from stationary tissue are the same from pulse to pulse.

Color Doppler Velocities recorded in a sample volume of the pulsed wave Doppler can be presented with a color. A color scale from blue to red is conventionally used. Blue color implies velocities (movement) away from the transducer and red color implies velocities (movement) towards the transducer.

For quantitative and qualitative evaluation of flow within the major hepatic arteries and veins, the Doppler US examination should include both a color and a spectral waveform analysis. The basic principles of Doppler US have been well described in excellent reviews (, 3-, 5). The color Doppler flow US examination measures and color codes the mean Doppler frequency shifts that occur in moving blood and superimposes a color depiction of these data on the gray-scale image, thereby providing ...

Color Doppler or color flow Doppler is the presentation of the velocity by color scale. Color Doppler images are generally combined with grayscale (B-mode) images to display duplex ultrasonography images, allowing for simultaneous visualization of the anatomy of the area.

Abstract. For over 30 years, the Doppler effect has been used to identify blood flow with ultrasound. Many Doppler techniques are currently available, including continuous-wave Doppler, pulsed Doppler, color Doppler, and power Doppler. Each Doppler technique has strengths and limitations. Color Doppler provides a survey of blood flow in real time, which has improved our ability to detect and characterize vascular abnormalities throughout the body.
